Radio wiring harness colors

This article explains how to identify car speaker wire colors when installing a car stereo. The easiest way to wire in an aftermarket car stereo is to look at car stereo wiring diagrams for the specific vehicle and head unit, but it's actually possible to get the job done without any labels, adapters, or diagrams. Although there are exceptions to every rule, most aftermarket car stereos use a standardized coloring scheme for the power, ground, antenna , and speaker wires. If you have the pigtail that came with your aftermarket head unit, and it uses the standard colors, then the wires will have the following purposes and colors:. If you find yourself with a used car stereo that you want to install, and you have the pigtail that came with the head unit, then it's usually just a process of checking the list above to see what each wire in the pigtail needs to connect to. The reason that car stereo wiring harness adapters are so useful is that while aftermarket car stereos have all the same inputs and outputs as the factory stereos that they're designed to replace, those inputs and outputs aren't all in the same places. If you can get your hands on the right car stereo wiring adapter, it vastly simplifies the installation process. One end of the adapter plugs into the car stereo , the other end plugs into the wiring harness that originally connected to the factory stereo, and that's all there is to it. The problem is that while harness adapters are fairly inexpensive, and they're available for a wide variety of car and head unit combinations, there really isn't any wiggle room in terms of compatibility. For a head unit wiring harness to work, it needs to be specifically designed for both your vehicle and your new head unit. If you can't figure out the specific model of a used head unit, then you're better off identifying the purpose of each wire and just manually connecting everything the right way. In that same vein, there is also a chance that there just isn't an adapter available for any given combination of vehicle and head unit. While it is technically possible to install a head unit without a wiring harness , it is a whole lot more complicated than the sort of basic head unit installation process that most do-it-yourselfers are comfortable with. The picture below shows the wiring color codes for a CEA aftermarket radio harness that is included with most radios. You Are essentially continuing the flow of an electrical circuit when your connecting a wiring harness for your stereo. Crimp caps are pretty easy to find at your local parts shop, even at your local car audio shop. Soldering is a bit more difficult, your using a soldering iron that gets extremely hot to melt led free solder onto your wiring connection. I promise this is easier than it sounds. Heres a quick video with a pretty in depth explanation of wiring a harness. Pay attention to how neat he keeps his wires, this is important. Keeping your wiring neat can help to kill the chance of wires shorting out. This wiring harness adapter that you need is specific to the year, make and model of your vehicle. The cool thing is that it also follows the same CEA wiring color codes that are shown in the picture above. So all you need to do is to connect them by matching them color to color. However, there are a few pieces of information you need to know in order to find out. You know them very wellâ€!. They all have to do with your vehicle and the options it may or may not have. If you answered yes to number 5 then you wont need a radio harness more than likely. Generally shops use a wiring harness to install aftermarket radios assuming there is a harness on the market for that vehicle. If you answered yes to number 4 then youll need a special harness that provides a low level signal to your factory amplifier. You may not know you have an amplifier, or a factory subwoofer. If you are looking to find a wiring harness for your specific vehicle, I recommend using this easy vehicle fit-guide source. All you have to do is to enter your vehicle information and they show you everything you need! If you have any questions you can contact us by sending us a message on Facebook. Its pretty frequent that we get customers that have audio issues due to factory amplifier or speaker mishaps that require an amp [â€!]. This article explains how to identify wiring using a multimeter or simple light test. The other is only hot when the ignition key is on, which prevents

the radio from being left on after you've taken the key out. In cases where a vehicle has a third power wire, it is used for a dimmer function that's tied to the headlights and the dash light dimmer switch. The first power you'll want to check for is the constant 12V wire, so set your multimeter to the appropriate scale, connect the ground lead to a known good ground, and touch the other lead to each wire in the speaker wire. When you find one that shows approximately 12V, you have found the constant 12V wire, which is also referred to as the memory wire. Most aftermarket head units will use a yellow wire for this. After you have marked that wire and set it aside, turn the ignition switch on, turn the headlights on, and turn the dimmer switch - if equipped - all the way up. If you find two more wires that show approximately 12V, then turn the dimmer switch down and check again. Most aftermarket head units usually use an orange wire or an orange wire with a white stripe for this. The wire that still shows 12V is the accessory wire , which is usually red in aftermarket wiring harnesses. If only one wire ever had power in this step, it is the accessory wire. With the power wires marked and out of the way, you can move on to checking for the ground wire. If you can't locate the ground wire visually, then the best way to locate the ground wire is with an ohmmeter. You just have to connect the ohmmeter to a known good ground and then check each of the wires in the car stereo harness for continuity. The one that shows continuity is your ground, and you can move on. Figuring out the speaker wires can be a little more complicated. If the remaining wires are in pairs, where one is a solid color and the other is the same color with a line, then each pair typically goes to the same speaker. You can test this by connecting one wire in the pair to one end of your AA battery and the other end to the other terminal. If you hear a sound come from one of the speakers, then you have identified where those wires go, and you can repeat the process for the other three pairs. In order to be absolutely certain, you have to actually look at the speaker when you trigger it. If the cone appears to move inward, then you have the polarity reversed. This is a longer process, but it works just the same. Jeremy Laukkonen. Jeremy Laukkonen is tech writer and the creator of a popular blog and video game startup.
